TISSUE SPECIFICITY: EXPRESSED IN 20-22 SENSORY NEURONS ON THE
MEDIAL-PROXIMAL EDGE OF THE ANTENNA. THIS EXPRESSION PATTERN
MATCHES THE DISTRIBUTION OF THE LARGE SENSTILA BASICONICA.
EXPRESSION IS FIRST SEEN AT 60 HOURS APF IN A SUBSET OF CELLS
RESTRICTED TO A SUBREGION OF THE DEVELOPING ANTENNA. EXPRESSION
CONTINUES THROUGHOUT ANTENNAL DEVELOPMENT.
SIMILARITY: Belongs to family Dr-or of G-protein coupled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         D -> TICFDKFFYLPYFFS (IN REF. 3).

WPI; 2001-244398/25.

Novel polypeptides useful for treating HIV infection, have homology to regions of domains of human chemokine receptors CCR5, CXCR4 and STRL33, and binds to HIV gpl20 under physiological conditions.

Claim 21; Page 38; 114pp; English.

The present invention describes a number of peptides which are able to bind to HIV glycoprotein 120 (gp120). These are similar to the human chemokine receptors CCRS, CXCR4 and STR13, as well as CD4. These are useful in the treatment of HIV, as they prevent replication of the virus. The present sequence is an example of a peptide of the invention

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and infilamatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                          New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective; antidiamatory; gene therapy; antiseaspy; thycominetic; NOVX; pathology; cancer; diabetes; obesity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing;

```

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.

WPI; 1997-549729/50. N-PSDB; AAT99542. Polynucleotide encoding MMLR-CCR or MPHG-CCR chemokine receptor - useful to study, diagnose and treat, e.g. infection, inflammation, solid tumour and proliferative and cardiovascular disease.

Claim 8; Page 37-38; 59pp; English.

This protein comprises human MMIR-CCR, a novel C-C chemokine receptor associated with monocyte/macrophage infiltration and chemotaxis and haematopoiesis. The amino acid sequence was deduced from a cDNA clone (see AAT99542) obtained from a cDNA library made from monouclear cells collected on day 2 of a mixed lymphocyte culture, i.e. cells associated with inflammation and immunomdulation. Another novel chemokine receptor, MPHG-CCR (see AAN36767), is also claimed. MMIR-CCR contains 7 transmembrane spanning segments connected by a serives of intracellular cand extracellular loops. MMIR-CCR and MPHG-CCR can be used to study, diagnose and treat disease states in which normal leukocyte function is perturbed by normal leukopoiesis or inappropriate activation via chemokine agoniers or antagoniers, such as infection, inflammation, proliferative disease, tumourigenesis, autoimmune disease, abnormal cell arthus, anysathenia gravis, diabetes, inflammatory bowel disease, toxic shock syndrome, septic shock and Chediak-Higashi syndrome

```
This polypeptide sequence comprises novel human chemokine receptor 88C, a G protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a CDNA clone (AATS161) isolated from a marcophage library. It shows 62% identity to CCCKR1. Chemokine receptor 88-28 (see AAW27124) has also been identified. 88C and 88-28 receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G brotein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding chemokine receptors 88-2B and 88C - used modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 118; DB 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattractant protein 1 (WCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CCR-5 is also a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriaais, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders
                                                                                                                           Human Cys-Cys chemokine receptor 5; CCR5; human immunodeficiency virus; type 1; type 2; HIV-1; HIV-2; diagnosis; treatment; prevention; inflammatory disease; rheumatoid arthritis; glomerulonephritis; asthma; idiopathic pulmonary fibrosis; psoriasis; viral infection; cancer; atherosclerosis; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Active and inactive forms of human CC chemokine receptor CCR-5 - useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection.

                                                                        Chemokine receptor 88C, atherosclerosis; rheumatoid arthritis; tumour; asthma; viral infection; AIDS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking; G protein coupled receptor; ligand; modulator; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This polypeptide sequence comprises macaque chemokine receptor 88C, a G protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a 88C DMA (AARBSIGS) isolated by PCR amplification. It shows 97% identity to human 88C GAMW7123). 88C receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response abnormal haematopoietic processes etc. A hybridoma that produces an antibody that specifically binds to macaque 88C is claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G-protein chemckine receptor; HDGNR10; signal transduction;

                                                                                                                                                                                                                                                                                                  Novel human mature G-protein chemokine receptor HDGNR10 (AAW07602) is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a CDNA clone (AAT44042) isolated from a human monocyte library. Isolation of the CDNA allows prodn. of recombinant HDGNR10 in host, e.g. E. coli, COS or Sf9, cells. The recombinant receptor can be used to identify agonists or antagonists of the receptor; such cpds. can be used to identify agonists or antagonists of the receptor; expression of G-protein chemokine receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC chemokine receptor 5; CCR5; G-protein coupled receptor; human immunodeficiency virus; HIV; CD4; AIDS; therapy; transgenic animal.
                                                                                                                                                                                                                      Human G-protein chemokine receptor, HDGNR10 - useful to identify (ant)agonists, for treatment of haematopoiesis, leukaemia, chronic and acute inflammation, rheumatoid arthritis, etc.

chemokine receptor that has been designated CCRS. The sequence was deduced from an isolated CDNA clone (see AAT76920). An Ala127Leu variant (see W238340 of CCRS was also identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCRS. CCRS is a member of the 7-transmembrane superfamily of G-protein coupled call surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that infection. Antibodies that bind to CCRS, CCRS variants, and CCRS-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage tropic strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Answars of the infection by macrophage-tropic (W-tropic) strains of HIV-1. The invention relates to the identification of a CCRS variant (see Anwasz1), designated CCRSm303, comprising the first two transmembrane commans of wild-type CCRS, but lacking transmembrane domains 3-7. The presence of the CCRSm303 variant with the wild type CCRS allele shows a presence of the CCRSm303 variant with the wild type CCRS allele shows a craims, and may indicate slower progression of the disease. The detection of CCRS variants may be used to identify individuals at lower crise of intection who, if infected, may exhibit slower progression to AIDS. Probes and primers (see AAV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCRS receptor. This involves introducing a nucleic acid encoding a CCRS variant into the cell, thereby reducing the number of functional CCRS molecules present on the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a human G-protein chemokine receptor designated HDGNR10 polymucleotides are useful in methods of screening to compounds which bind to and either: (1) activate the HDGNR10 polypeptides causing stimulation of haematopolesis, wound healing, coagulation, and angiogenesis; treatment of solid tumours, chronic infections, leukaemia, T-cell mediated autoimmune diseases, parastic infections, psoriasis, and to stimulate growth factor activity; or (2) inhibit activation of the HDGNR10 polypeptides which is useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin B-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, slicosis, sarcoidosis, theumatoid arthitis shock and hyper-eosinophilia syndrome. The polymucleotides are also useful for diagnostic assays for detecting diseases related to mutations in the nucleic acid sequences encoding the polympetides and for detecting an altered level of the soluble form of the receptor polypeptides. The polymucleotides are also useful for in vitro purposes related to altered level of the soluble form of the receptor polypeptides. The polymucleotides are also useful for in vitro purposes related to constitute of DNA vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                 Human, G-protein coupled receptor, G-protein chemokine receptor, HDGNR10, diagnosis; haematopoiesis; wound healing; coagulation; angiogenesis; nucur, infection; leukaemia; psoriasis; allergy; T-cell mediated autoimmune disease; atherogenesis; anaphylaxis; inflammation; allergic reaction; silicosis; sarcoidosis; theumatoid arthritis; hyper-eosinophilia syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid encoding human G-protein chemokine receptor useful for diagnostic assays, scientific research and screening for compounds which bind to and activate or inhibit activation of the receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The specification describes an antibody which is specific for an antigenic fragment of gpl20. This antigenic fragment binds to DC-SIGN or conformational change. Drinding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by infection. The present sequence represents a human CCRS protein, which is a translocation promoting agent that interacts with CD4. This receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; G-protein chemokine receptor; CCR5; HDGNR10; inflammation; HIV; human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostatic; immunosuppressive; nootropic; neuroprotective; gene therapy; neurodegenerative disorder; Kaposi's sarcona; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative collitis; Crohn's disease; wound healing; cardiovascular disorder; myocardial ischaemia.

interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cycomegalovirus infection, an autoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCR5 expression, lack CCCF ligand expression, or lack of CCR5 ligand expression, or lack of CCR5 ligand correase or decrease storage capabilities. CCR5 HGGMR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCR5 HGGMR10 DNA, or correction, antibodies, agonists and antagonists are also useful in the protein, antibodies, agonists and antagonists are also useful in the diagnosis, treatment and prevention of cancer (breast, ovary, adrenal curogenital); immune disorders (Adabson's disease, allergies, autoimmune thyroiditis, diabetes mellitus, crohm's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular disorders (mycardial ischaemias) and wound healing. The present sequence is human CCR5 HDGNR10 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, G-protein chemokine receptor, CCR5, HDGNR10, inflammation, HIV, human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostatic; immunosuppressive, noctrobic, neuroprotective; gene therapy; reurodegenerative disorder; Kaposi's sarcoma; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestimal tract; lung; liver; immune disorder; Addison's disease; haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative colitis; Crohn's disease; wound healing; cardiovascular disorder; myocardial ischaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human G-protein chemokine receptor (CCR5) HDGNR10 polypeptides and polynucleotides. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as Pneumocystis carinii pneumonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              187...305

The invention relates to human G-protein chemokine receptor (CCRS)

HDGNR10 polypeptides and polynucleotides. CCRS HDGNR10 antibodies are
useful for treating, preventing or ameliorating a disease or disorder
associated with inflammation, defective or aberrant chemotraxis of immune
cells, HTV infection (such as Pneumocystis carinii pneumonia or Kaposi's
sarcoma) or defective or aberrant T-cell antigen presenting cell
interaction. The disease or disorder may also be an infectious disease
control infection such as an early stage HTV infection, a
cytomegalovirus infection, or a poxvirus infection, a nautoimmune
control interaction arthritis) or a neurodegenerative disorder. The
disease or disorder may be associated with aberrant CCRS expression, lack
of cCRS function, aberrant CCRS ligand expression, or lack of CCRS ligand
function. CCRS HDGNR10 protein is used as a food additive or preservative
control increase or decrease storage capabilities. CCRS HDGNR10 DNA,
control of a disposite and antegonists are also useful in the
disposis, treatment and prevention of cancer (breast, ovary, adrenal
control, bone, bone marrow, gastrointestinal tract, liver, lung,
dispositial); immune disorders (Adabetes mellitus, Crohn's
curogenital); immune disorders (Adabetes mellitus, Crohn's
curogenital); immune disorders (Adabetes mellitus, Crohn's
curogenital); cardiovascular disorders (mycavalial ischaemias) and wound healing. The
control or present sequence is human CCRS HDGNR10 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatio), organ rejection, inflammation and autoimmune diseases. Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthmat or chronic bowel inflammation), or autoimmune diseases (rheumatoid arthritis or lupus), where the (cardio) vaccular, lymphatic, respiratory, nervous, diseative, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives immunosuppressive, dermatological, antirheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a constellation of chemokine cand inflammatory cells through a proliferation of these cells. Adagnots-AAG80128 represent human chemokine fragments used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; transformed mammalian cell; CD4; reporter gene; translocation; human immuno deficiancy virus; HIV; long terminal repeat; LTR; therapy; chemokine receptor; CKR; cellular dysfunction; HIV infection; cofactor; CC-CKR-5; envelope glycoprotein; anti-HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transformed mammalian cell (I) that contains a CD4 gene, reporter gene and HIV LTR for identification of drugs and antibodies for treatment of

contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HIV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CTR) where the CD4 and the CMR are present on the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the translocation of HIV into transformed mammalian cell or for identifying a human chemokine receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat sequence is a human chemokine receptor (CTR), CC-CTR-5 related protein. CC-CTR-5 is the principal coffector for entry mediated by the envelope glycoproteins of primary macrophage-tropic strains of HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; G-protein chemokine receptor; CCR5; HDGNR10; inflammation; HIV; human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostetic; immunosuppressive; nocropic; neuroprotective; gene therapy; neurodegenerative disorder; Kaposi's sarcoma; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary; adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic anemia; autoimmune thyroiditis; diabetes mellitus; allergy; multiple sclerosis; ulcerative colitis; Crohn's disease; wound healing;

The present sequence is human G-protein chemokine receptor (CCR5) HDGDRIO protein. CCR5 HDGDRIO cDNA is included in ATCC Deposit No: 97183. CCR5 HDGNRIO antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells. HIV infection (such as Pneumocystis carini presenting cell interaction. HIV infection (such as Pneumocystis carini presenting cell interaction. A presenting cell interaction. The disease or disorder may also be an infection, a cytomegalovirus infection or a poxvirus infection, an infection, or a poxvirus infection, an infection, a cytomegalovirus infection, or a poxvirus infection, or a poxvirus infection, or a poxvirus or a neurodegenerative contoinmune disease (e.g. rheumatoid arthritis) or a neurodegenerative contoinmune disorder may be associated with aberrant CCR5 disorder. The disease or disorder may be associated with aberrant CCR5 captression, lack of CCR5 function. Aberrant CCR5 ligand expression, or a packed with aberrant CR5 contoin additive or preservative to increase or decrease storage capabilities. CCR5 HDGNRIO DNA are useful for chromosome identification and in gene conterned to overy adrenal gland, bone, bone marrow, gastrointestinal tract, care also useful in the disapnesis, treatment and prevention of cancer contemmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, colitis), cardiovascular disorders (myocardial ischaemias) and wound colitis), cardiovascular disorders (myocardial ischaemias) and wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10 protein. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, ameliorating a disease or disorder associated with inflammation. CCC defective or aberrant chemotaxis of immune cells, HIV infection (such as Pneumocystis carinii pneumonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection), an autoimmune disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CCRS expression, lack of CCRS function, aberrant CCRS is an early of cression, and of CCRS ligand function. CCRS HDGNR10 protein is used as a food additive or preservative to increase or decrease storage capabilities. CCRS HDGNR10 DNA are useful for chromosome storage capabilities and antagonists are also useful in the diagnosis, treatment and prevention of cancer (breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple selerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular cultisorders (myocardial ischaemias) and wound healing

Claim la; Page 15; 22pp; English.

This invention describes a novel receptor polypeptide (I) selected from (I) a fully defined 329 amino acid sequence (II) fully disclosed in the specification; and (II) a polypeptide encoded by the cDNA contained in a plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the invention have antiinflammatory, immunomodulatory, anticoagulant, antiallergic, immunosuppressive, vulnerary, cytostatic, antiparasitic, antiparatic, antianting cape therapy. The G-products of hemokine activate or inhibit activation of (I). The products of the invention can also be used for stimulating hematopoiesis, wound healing, coagulation, angiogenesis, treating solid tumours, chronic infections, psoriasis, and stimulating growth factor activity. HDGNRIO is useful for treating solute inflammation, histamine and immunoglobulin E (IgB) mediated allergic reactions, prostaglandin-independent fever, bone marrow failure,

This sequence represents the human CCR5 protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemotractic chemokine receptor 5 (CCR5) with gpl20, comprising incubating the agent with CCR5 and gpl20 and determining whether the agent modulates the interaction, where gpl20 is associated with CDR, and where the interaction is a low affilmity binding. The method is used to identify an agent capable of modulating the interaction of CCR5 with gpl20. An agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCR5 and gpl20 interaction, to treat a subject with a disease or condition associated with CCR5 and gpl20 interaction, to treat a subject with a disease or condition associated with CCR5 and gpl20 interaction, and for preparing a pharmaceutical for treating human immunodeficiancy virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining if an agent can modulate CCRS-gp120 interaction, comprises incubating the agent with CCR5 and gp120 and determining if the agent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying agonists of G protein-coupled receptors (GPCRs) for use in disease treatment, comprises contacting candidate compounds with versions of GPCRs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR
                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Homo sapiens

The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids caste that determines the specificity of the interaction between CCR5 and HIV-1 gpl20. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminus is required for gpl20 binding and may critically modulate the susceptibility of target cells to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AAB82947) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV infection of CO4+ cells, of preventing CD4+ cells from becoming infected with HIV, of treating a subject whose CD4+ cells are infected with HIV, and of identifying an agent which inhibits binding of a CCR5 ispecially a human, infected (therapeutic method), not infected with HIV (prophylactic method), not in a subject who is not infected with, but has been exposed to, HIV CCR5; chemokine; co-receptor; human immunodeficiency virus type 1; HIV-1; infection; therapy; vaccine; anti-HIV-1. Novel compounds comprising specific amino acids within CCR5 (HIV 1 crreceptor) amino terminal domain including negatively charged and two sulfated tyrosine residues is useful for treating HIV infection in Gaps ö Length 352; Indels Human G-protein chemokine receptor (CCR5) HDGNR10 #1. ```
The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HPGNR10, and polymucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HPGNR10 and polymucleotide.

Chuman G-protein chemokine receptor (CCR5) HPGNR10 and polymucleotide.

Sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (sepecially early stage human immune deficiency virus (HIV), cytomegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis and monitoring of cancer and other hyperpoliferative diseases. The polymucleotide sequences encoding human combinant receptor, and in the treatment of a wide range of diseases such as infectious diseases (e.g. influenza), neurological diseases (e.g. HDGNR10 #H).

Parkinson's disease, and hyperproliferative disorders (e.g. cancer). The HDGNR10 #H]

                                                                                                                                                                                                                                                                                                                                                                                     27-SEP-2001
The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polymucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polymucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegalovius or pox virus infections, Kapoesi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis, and monitoring of cancer and other hyperproliferative diseases. The polymucleotide sequences encoding human d-protein chemokine receptor (CCR5) HDGNR10 can be used to produce the recombinant receptor, and in the treatment of a wide range of diseases councing a infectious diseases (e.g. influenza), neurological diseases (e.g. cancer). The present sequence represents human G-protein chemokine receptor (CCR5) protein chemokine receptor (CCR5) present sequence represents human G-protein chemokine receptor (CCR5) present sequence represents human G-protein chemokine receptor (CCR5) presents and pyperpocial diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCR5, useful for treatment and diagnosis of e.g. inflammation.

The invention relates to a method for identifying a binding compound for chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then dentifying those molecules which bind. The invention also relates to cdentifying chose molecules which bind. The invention also relates to crR5-binding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding peptides, a cransfer vector encoding tagged CCR5, a computer-aided methods for determining the relative binding assay that utilises the three-dimensional computer aided drug screening assay that utilises the three-dimensional etricules of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HTW (human consense) in a patient. The methods of the invention may also be used to syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5 with its natural ligand, and to determine a binding motif for CCR5. The present sequence represents a naturally occurring variant of human cCR5 in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
The invention relates to a method for identifying a binding compound for CC chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then identifying those molecules which bind. The invention also relates to cCR5-binding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided methods for determining the relative binding assay that utilises the three-dimensional computer aided drug screening assay that utilises the three-dimensional computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HIV (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5. The present sequence represents human CCR5.
                                                                                                                                           CCR5; CC chemokine receptor 5; human; HIV infection; human immunodeficiency virus; AIDS; acquired immunodeficiency syndrome; drug screening; identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCR5 and identifying bound molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tan Hehir CA;

The present invention relates to the isolation of human G-protein chemokine receptor, HDGNR10 (CCR5 receptor), and the polymucleotide sequences are conding it. HDGNR10 polymeptide and polymucleotide sequences are or useful for diagnosing a disease or a susceptibility to a disease related to underexpression of HDGNR10. They are useful for identifying modulators for stimulating haematopoiesis, wound healing, coaquilation, angiogenesis, to treat solid tumours, chronic infections, psoriasis, or for stimulating growth factor activity. The sequences are also useful for preventing and/or treating allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgE)-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, sarcoidosis, rheumatoid arthitis, shock and hyperbone marrow failure, sarcoidosis, rheumatoid arthitis, shock and hypercessinophilic syndrome. Polymucleotide sequences encoding HDGNR10 can be used in gene therapy to treat conditions related to underexpression of HDGNR10. The present sequence represents human G-protein chemokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.

Example 55; Fig 4; 562pp; English

The invention describes an isolated polynucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of antibody at least 95-100% identical to a second antibody consisting of a variable heavy (VH) or variable light (VL) domain of the antibody consisting of a variable heavy (VH) or variable light (VL) domain of the antibody consisting of xF3.6A2, XF3.1089, XF22.3C9.6, XF22.9E6, XF27/28.18E5, XF27/28

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM Rosen CA, Roschke V,

WPI; 2002-643455/69. N-PSDB; ABS68553.

New human G-protein Chemokine Receptor gene (HDGNR10) useful for treating, preventing, ameliorating or monitoring diseases or disorders associated with aberrant expression of HDGNR10 e.g. cancer.

Disclosure; Fig 1A-B; 562pp; English.

The invention describes an isolated polymucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of an antibody at least 95-100% identical to a second antibody consisting of an amino acid sequence comprising at least one, two or three CDR regions of a variable heavy (VH) or variable light (VL) domain of the antibody expressed by a hybridoma cell line consisting of XF3.5F1, XF11.1F8, XF27/28.18B5, XF27/28.25G10, XF27/28.18B5, XF27/28.18

CCR5 antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenty resenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis carinii infection, Raposi's sarcoma or any condition associated with aberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein
dermatitis and rheumatoid arthritis, allergies, a neurodegenerative disorder, a viral infection e.g. HIV infection, cytomegalovins or poxvirus infection, a Pneumocystis carnii infection, Kaposi's sarcoma, cardiovascular disorders such as atherosclerosis, lymphocytopenias, or a disease or disorder associated with aberrant expression of novel human Gprotein chemokine receptor (CCRS) HDGNR10. This is an amino acid sequence of Human G-protein chemokine receptor (CCRS) HDGNR10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding antibodies to the human CCRS receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also

                                                                                                                                                                                                                                                                                   g
```

```
The invention relates to human G-protein chemokine receptor (CCR5), antibodies are used for the treatment or prevention of inflammation, defective or aberrant chemotaxis of immune cells or T cell antigenpresenting cell interaction, viral infections (specifically human immune deficiency (including its early stages), cytomegalo or pox viruses), autoimmune deficiency Kaposi's sarcoma or any condition associated with aberrant expression of CCR5 or their ligands. They are also used for the detection, diagnosis, prognosis and monitoring of cancers or other hyperproliferative diseases. The present sequence is human G-protein chemokine receptor (CCR5), HDGNR10 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding antibodies to the human CCR5 receptor HDGNR10, useful for treatment, prevention and diagnosis of e.g. cancer, also related antibodies.
                                                                                                                                                Human, G-protein chemokine receptor; CCR5, HDGNR10 protein; cancer;
inflammation; viral infection; autoimmune disease; neurodegeneration;
rheumatoid arbhritis; Pneumocystis carinii infection; Kaposi's sarcoma;
hyperproliferative disease; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 118; DB 5; Length 352;

The present sequence is that of a polypeptide encoded by the human chemokine (C-C motif) receptor 5 (CCR5) gene of the invention (See ABA97319). The specification describes haplotyping the CCR5 gene of an individual by determining if the individual has one of the CCR5 specification also describes an isolated polymothetoride comprising a nucleotide sequence which is a polymorphic variant of the reference CCR5 gene sequence which is a nisogene defined by a haplotype described nucleotide sequence and comprises an isogene defined by a haplotype described in the specification and its encoded polypeptide. The methods of the invention are useful to diagnose and develop treatment for diseases a ssociated with abnormal expression or function of the gene. The CCR5 isogenes and the screened compounds are useful for treating human communodeficiency virus (HIV)-1 infection and the progression to acquired immunodeficiency virus (HIV)-1 infection and the progression to acquired immunodeficiency syndrome (AIDS). The invention has antiviral complications are specification describes genotyping the CCR5 gene of an individual; predicting a haplotype pair for the CCR5 gene of an individual; predicting a passociation between a trait and a haplotype or haplotype pair for the CCR5 gene. The specification describes a composition comprising a genotyping oligonucleotide for detecting a CCR5 polymorphism; a recombinant non-human organism transformed with CCR5 polymorphism; a recombinant non-human organism transformed with expressing an isolated antibody specific for the CCR5 polypeptide and a method for screening drugs targeting the CCR5 polypeptide.
                                                                                                  Human chemokine C-C motif receptor 5; CCR5; haplotype pair; isogene; single nucleotide polymorphism; SNP; human immunodeficiency virus 1; HIV-1 infection; acquired immunodeficiency syndrome; AIDS; antiviral; genotype; polymorphic variant; transgenic; drug screening; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New haplotypes of the human chemokine (C-C motif) receptor 5 gene, to diagnose and treat diseases associated with its abnormal express function, including human immunodeficiency virus-1 infection.
                                                              Human chemokine (C-C motif) receptor 5 polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              which has been identified as a G-protein chemokine receptor. The GPCR HDGNR10 polypeptide can be expressed by standard recombinant methodology. Compounds that activate or inhibit the receptor polypeptide, optionally expressed from DNA in gene therapy vectors; are used to treat diseases that require: (a) activation of the receptor (e.g. stimulation of haematopoiesis, treatment of solid tumours, T-cell mediated autoimmune diseases, parasitic infections, psoriasis etc.); or (b) inhibition of the receptor (e.g. allergy, inflammation, rheumatoid arthritis, silicosis etc.). The present sequence represents the human HDGNR10 receptor
                                                                                                                                                                                                                                                                                                                                                                                  7-transmembrane receptor; G-protein coupled receptor; GPCR; HDGNR10; G-protein chemokine receptor; haemacopoleric; immunosuppressant; antiparasitic; antiparasitic; antiparasitic; antiballergic; antiballergic; antiballergic; antiballergic; antiballergic; antiballergic; antiballergic; antiballergic; antiballergic; antiparthritic; gene therapy; human; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polynucleotide encoding a human G protein chemokine receptor HDGNR10,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel human 7-transmembrane receptor, HDGNR10,

The invention discloses a G-protein chemokine receptor (sometimes creferred to as a 7-transmembrane receptor) polypeptide, HDGNR10, and the polymucleotide encoding it. G-protein chemokine receptors are involved in a gignal transduction pathways. The polymucleotide and polypeptide can be used to identify compounds which activate or inhibit activation of the used to identify compounds are useful for treating a patient having need to activate or inhibit a G-protein chemokine receptor. The compound is administered by providing to the patient DNA encoding the agonist. Or antagonist and expressing them in vivo (gene therapy). The polymucleotides and polypeptide are also useful for for diagnosing a disease or susceptibility to a disease related to an under-expression of the protein. For chromosome identification or as immunogens for producing antibodies. Agonists are useful in strimulating haematopoiesis, whond healing, coaqulation, angiogenesis, to treat solid tumours, chronic infections, portains and to stimulate growth factor activity.

Antagonists are useful in the prevention and treatment of allergy, attentogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histermine and igE-mediated allergic reactions, prosteals and to stimulate growth factor activity.

Antagonists are useful in the prevention and reatment of allergy, attentogenesis, anaphylaxis, malignancy, chronic and acute inflammation, shock and hyper-eosinophilic syndrome. The sequence presented is the thurn HDGNR10 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human G-protein chemokine receptor polypeptide useful for diagnostic purposes and for identifying modulators of the polypeptide useful for treating leukemia, autoimmune diseases, psoriasis and allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; receptor; G-protein chemokine receptor; 7-transmembrane receptor; HDGMR10; signal transduction; gene therapy; haematopoiesis; wound healing; coagulation; angiogenesis; tumour; chronic infection; leukaemia; T-cell mediated auto-immune disease; parasitic infection; psoriasis; growth factor; allergy; atherogenesis; anaphylaxis; prostay; inflammation; histamine; Igg-mediated; prostaglandin-independent fever; bone marrow failure; silicosis; paracoidosis; rheumatoid arthritis; shock; hyper-eosinophilic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human G-protein chemokine receptor, HDGNR10, protein.

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cegulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in ABR585121 to ABR58709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a cut greening assay. The nucleic acid is useful for therapeutic targete. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, colladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, abhances, prostate, skin and uterus), wounds, ischemia, heart diseases, ather seconds and endometriosis. The nucleic acid is also useful in a control of any seconds and endometriosis. The nucleic acid is also useful in a control of any seconds and endometriosis. The nucleic acid is also useful in a control of any seconds and endometriosis. The nucleic acid is also useful in a control of any seconds and endometriosis. The nucleic acid is also useful in the control of the patient by administry for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New genes that are up-regulated or down-regulated in cancers, useful a markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                            Human, cancer; diagnosis; screening; modulator; leukaemia; ischaemia;

The method is useful for identifying a compound for treating urological disorder comprising urinary incontinence e.g., overactive/oversensitive bladder, overflow urinary incontinence, stress urinary incontinence caused by defunction of the bladder, urethra or central/peripheral nervous system, prostatitis, benign prostatic hyperplasia, prostate cancer or kidney disorders. It is also used in gene therapy. The present sequence is human C-C chemokine receptor type 5 (CCRS, 333) protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                              Human; urological disorder; stress urinary incontinence; prostate cancer; beign prostatic hyperplasia; overactive bladder; oversensitive bladder; oversensitive bladder; overselve urinary incontinence; gene therapy; nephrotropic; prostatitis; kidney disorder; C-C chemokine receptor type 5; CCR5; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ដ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a compound, capable of treating urological disorder e.g., benign prostatic hyperplasia, by assaying the ability of the compound modulate 313, 333, 5464, 188717 or 33524 nucleic acid expression or polypeptide activity.

The invention relates to a method of producing an antibody, involving immunising an animal with a human G-protein chemokine receptor (HDGNR10) polypeptide (also referred to as a human 7-transmembrane receptor) and recovering an antibody which binds the polypeptide. The method is useful for producing an antibody which binds specifically to the human G-protein chemokine receptor polypeptide. This sequence represents the HDGNR10 polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                         Producing an antibody, involves immunizing an animal with a polypeptide or with a polypeptide encoded by the human G-protein chemokine receptor clone in ATCC 97183, and recovering the antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, chemokine receptor, CCR5, viral infection, surface protein, respiratory virus infection, respiratory syncytial virus infection, RSV infection, bronchiolitis, bronchitis, pneumonia, asthma.

                                                                                                                                                                                                                                                                                                                                         The present sequence represents human chemokine receptor CCR5. The specification describes a method for modulating viral infection of a cell. the method comprises modulating a binding interaction between a cell chemokine-receptor and a surface protein of the virus. The proviso is that the cell chemokine-receptor is not CX3CR1 and that the proviso is that the method is useful for treating or preventing respiratory virus infection in vertebrates, more particularly respiratory syncytial virus infections, and related diseases, e.g. bronchiolitis, bronchitis, pneumonia or asthma
                                                                                                                                                                                                                      Modulating viral infection of a cell, for treating or preventing respiratory virus infections, bronchitis, pneumonia or asthma, by modulating a binding interaction between a cell chemokine-receptor and surface protein of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (I) an assay for the detection of a particular Grand to an isolated antibody having high specificity and high affinity or and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for corresponding GPCRs. The antigenic peptides for treating immune-related disease, immunological-related diseases, collicated diseases, immunological-related diseases, collicated diseases, immunological-related cell proliferative diseases or autoimmune diseases, eg. ALDS, Alzheimer's disease, contential, fungal, protozoan or viral infections, altergies, osteoprossis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohm's disease, pain, psoriasis, concer, cardiomyopathy, chronic and acute inflammation, allergies, multiple sclerosis, pain, psoriasis, concer, espilepsy, asthma, tuberroulosis, obesity, nausea, hyperension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis. ABB22523 to ABB42869 encode GPCR proteins given in ABP81675 to ABB42252 to ABB42869 encode cemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              receptor; human; anti-HIV; virucide; HIV; SIV; 88-C; 88-2B; chemokine receptor; envelope protein; atherosclerosis; rheumatoid arthritis; tumour growth suppression; asthma; viral infection; AIDS; inflammatory condition.
                                                                                                                                      " isolated antigenic peptides e.g., for G protein-coupled receptors PCR), useful for diagnosing and designing drugs for treating conditions which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or

The invention relates to screening for a modulator of human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV)
infection, comprising contacting a first composition having an human (ADC03341) or macaque (ADC03359) 88C chemokine receptor polypeptide with a second composition having an HIV or SIV envelope protein in the presence or absence or acompound. Also included are screening for a modulator of HIV infection, detecting HIV infection of colls (comprising contacting a cell that has been recombinantly modified to express at least one of human chemokine receptors 88C and 88-28 with HIV, and detecting HIV infection of cells (comprising contacting cells with an antibody to at least one of human chemokine receptors 88C and 88-28 with HIV, and detecting HIV infection of cells (comprising contacting cells with an antibody to at least one of human chemokine receptors 88C and 88-28 with HIV, and detecting HIV infection of the cell after the contacting step). The methods and compositions of the present invention are useful for the diagnosis and crivity of 88C or 88-28 bith HIV, and detecting HIV infection of activity of 88C or 88-28 chemokine receptors, such as atherosolerosis, rheumatoid arthritis, tumour growth suppression, asthma, viral infection, AIDS and other inflammatory conditions. The genes for human 88-C and 88-28 are located on chromosome 3921. The present sequence represents human chemokine receptor 88-C.
                                                                                                                                                                                                                                                                                                                                Screening for a modulator of HIV and SIV infection utilizing polymucleotides that encode the 88C or 88-2B chemokine receptors, useful for diagnosing and treating disorders such as atherosclerosis, arthritis, AIDS and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 2; Page 17-18; 29pp; English.

Batent No. 6153431
GENERAL INFORMATION:
APPLICANT: QUILLEN et al.
TITLE OF INVENTION: HUAN INFUNDEFICIENCY VIRUS CO-RECEPTOR
TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.
NUMBER OF SEQUENCES:
ADDRESSEB: Baker & Botts, L.L.P. attn. Lisa Kole
STREET: 30 Rockefeller Plaza
CITER: New York
STATE: New York
COUNTRY: USA

Sequence 2, Application US/08724984A

Patent No. 6388055

GENERAL INFORMATION:

TITLE OF INVENTION: No. 6388055e1 Mouse Genomic Clone of the CC-TITLE OF INVENTION: CRRS Receptor

NUMBER OF SEQUENCES: 5

CORRESPONDENCE ADDRESS:

ADDRESSEE: SmithKline Beecham Corporation

STREET: 709 Swedeland Road, P.O. Box 1539

CITY: King of Prussia

STATE: PA

COUNTRY: USA

COUNTRY: USA

INCOMPTER: IBM 48

COMPUTER: IBM 486

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-09-796-202-1

JUSTON-4945-669-2, Application US/08446669

Patent No. 6132987

GENERAL INPORMATION:

APPLICANT: Coughlin, Shaun

TITLE OF INVENTION: PROTEIN RECEPTORS

NUMBER OF SEQUENCES: 14

CORRESPONDENCE ADDRESS:

ADDRESSEE: Cooley Godward Castro Huddleson & Tatum

STREET: 5 Palo Alto

GENERAL OF INVENTION: PROTEIN RECEPTORS

NUMBER OF SEQUENCES: 14

COUNTRY: USA

COUNTRY: USA

COUNTRY: USA

COMPUTER: Falo Alto

STATE: Palo Alto

STATE: ABADBLE FORM:

MEDIN TYPE: Floppy disk

COMPUTER: IBM PC compatible

OMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

OMPUTER: IBM PC compatible

OMPUTER: IBM PC compatible

OMPUTER: MAY 25, 1995

CURRENT APPLICATION DATA:

HAPLICATION: 435

ATTONEY AGENT INFORMATION:

NAME: Neeley, Richard

REGISTRATION NUMBER: 30,092

REFERENCE/DOCKET NUMBER: 30,092

REFERENCE/DOCKET NUMBER: 30,092

REFERENCE/DOCKET NUMBER: 30,092

RELECHONE: 415-847-0663

FELLECHONE: 415-847-0663

FELLECHONE: 415-847-0663 TELERAX: 415-857-0663
TELEX: 380816CooleyPA
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 374 amino acids

Palo Alto California

```
RESULT 29
US-09-087-232A-22
Sequence 22, Application US/09087232A
; Sequence 22, Application US/09087232A
; Patent No. 6153431
; GENERAL INFORMATION:
    APPLICANT: QUillent et al.
    TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.
    TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.
